## Description

The PAM410 is specifically designed for measurements on electrical power systems. It is capable of displaying the phase angle relationship between two power signals, which can be two currents, two voltages or any combination. Currents up to 25 A and voltages up to 500 V can be applied directly to the instrument. The current input range can be extended by using external current transformers.

Example of phase angle shown on display

## Application

The PAM410 is suitable for checking polyphase metering installations, testing protective relays, make comparative test in electrical substations, and verifying the phase angle deviation on power transformers.

## Features and benefits

- Direct digital reading down to tenths of a degree ( $0.1^{\circ}$ ) does not require calculation or interpretation.
- Designed for use in substation or industrial environments transport case provided for rugged protection.
- Switchable inputs between current and voltage - allows phase angle of any combination of two power signals to be measured giving broad application capability.
- Local calibration

## Specifications PAM410

Specifications are valid at nominal input voltage and an ambient temperature of $+25^{\circ} \mathrm{C},\left(77^{\circ} \mathrm{F}\right)$. Specifications are subject to change without notice.

## Environment

| Application field | The instrument is intended for use in high-voltage substations and industrial environments. |
